

Verify if a number is prime. Should contain 2 types of lexical errors.

```
num $ read("Enter the number: ")
ok $ 0@a4 -> appearance of illegal characters
if num > 1:
    for i in rng(2, num//2): -> spelling error
        if (num % i) == 0:
            ok $ 1
            break
    if (ok == 0)
        print(num, "is a prime number")
    else:
        print(num, "is not a prime number")
else:
    print(num, "is not a prime number")
```
